## INTRODUCTION

1.1 This report summarizes the findings and recommendations of a traffic study conducted on Highway 281 north of the interchange of I-70 in Russell, Kansas. The study area extended north 0.5 miles to East Witt Avenue. The location of the study and intersections where traffic counts were taken can be found in Figure 1.

The City of Russell and local business owners have displayed interest in developing the area directly east of Highway 281 with additional commercial zoning. The additional traffic generated from this development needed to be evaluated so that the City and Kansas Department of Transportation (KDOT) could adequately plan for the growth in this area. Even without this potential growth, the City has expressed the desire to address some of the current safety issues.

A stakeholders meeting was held at the beginning of this study to gather information on the study area and the proposed development. In attendance were representatives from KDOT, the City of Russell, and the 24/7 Store.

### 1.2 Data Gathering

- Background traffic growth projections at the I-70 westbound on/off ramps were provided by KDOT.
- Kirkham Michael performed AM, Midday, and PM peak traffic volume counts at six intersections along US-281 from the I-70 westbound on/off ramps to East Witt Avenue.
- Site generated trips – *ITE Trip Generation Manual, 9<sup>th</sup> Edition, 2012*.
- Signal Warrant Analysis – *Manual of Uniform Traffic Devices, MUTCD 2009 Edition, Revision 2, effective March, 26, 2014*.
- Pass-by Trips – *ITE Trip Generation Handbook, an ITE Recommended Practice, March 2001*

### 1.3 Overview of Study Approach

To achieve the main goal of the study, the following tasks were accomplished:

- A site visit to observe the current lane configurations and geometry.
- Traffic counts were conducted as previously described in Data Gathering.
- A meeting was held with KDOT, the City of Russell, and one business owner to discuss possible future development.
- A roadway layout considering possible development was created.
- Proposed site development plan data was processed.
- Growth factors and crash data were obtained from KDOT.
- Background volumes were projected for 2025 and 2035 (design year).
- Pass-by trips were generated for possible development.
- Diverted-link trips were generated for the possible development.
- Primary trips were generated for possible development.
- Background volumes were adjusted for pass-by and primary trips.
- Determined 2015 and 2035 intersection capacities using Synchro Version 8.
- A traffic signal warrant analysis was completed.
- Recommendations for roadway and traffic control improvements was developed.

Figure 1 Wichita Ave

## EXISTING ROADWAY NETWORK CONDITIONS

Highway 281 is a four-lane, divided highway with frontage roads on both sides that connect to the local businesses. In the 0.5 mile stretch of the study area, there are six intersections, four of which connect directly to these frontage roads. Because of the close proximity of these accesses, it was proposed at the kickoff meeting that Intersection 3 (across from Pizza Hut) be converted to a right-in, right-out access. The lane layout for the study area is shown in Figure 2.

Traffic counts (see Appendix) were taken at six different intersections at consecutive 15-minute intervals during three periods; 6:30 – 9:30 AM, 11:30 AM – 1:30 PM, and 3:30 – 6:30 PM, for a total of 8 hours. These three times were taken to gather information during the three peak hours during a typical day. After reviewing the data gathered, it was determined that the highest weekday peak hourly volume occurs from 4:45 to 5:45 PM. These volumes represent the critical peak hourly volume used for this analysis and can be seen in Figure 3. The Lodge at Russell (east of Intersection 6) was recently under renovations, however, it was open during traffic counts and the volumes at this intersection were determined to be accurate.

Analysis of the existing PM peak hour volumes was performed using Synchro 8.0. The worst level-of-service (LOS) was westbound traffic at Intersection 2 (E. Edwards Avenue) which had a LOS of "C". LOS is a measure of effectiveness for intersection operating conditions, and is based on delay experienced by vehicles passing through an intersection. It can range from LOS "A" to LOS "F", with LOS "A" representing little or no delay. A LOS "C" or better is considered desirable. The following Table 1 shows the intersection LOS Criteria for both signalized and unsignalized intersections. The existing LOS can be seen in Figure 4 and Table 2.

**TABLE 1 – Intersection LOS Criteria**

Level of Service	Signalized Control Delay Range	Unsignalized Control Delay Range
A	$\leq 10$ seconds	$\leq 10$ seconds
B	$>10$ and $\leq 20$ seconds	$>10$ and $\leq 15$ seconds
C	$>20$ and $\leq 35$ seconds	$>15$ and $\leq 25$ seconds
D	$>35$ and $\leq 55$ seconds	$>25$ and $\leq 35$ seconds
E	$>55$ and $\leq 80$ seconds	$>35$ and $\leq 50$ seconds
F	$>80$ seconds	$>50$ seconds

## 2.1 Crash Analysis

A crash analysis and crash reports were supplied by KDOT detailing the crashes within the study area. The analysis showed a five-year crash rate of 1.514 per million miles of vehicle travel for Highway 281. The statewide overall crash rate for a similar type roadway is 0.676 per million miles of vehicle travel. With a crash rate of nearly twice the statewide average, additional review of the crash data was conducted.

Of the 13 reported crashes in the five-year period, four were near the intersection with Edward Avenue (Intersection 2). One of these was due to no headlights at night. The other three were failure to yield crashes where the drivers did not stay at the stop sign on the minor road until the major road was clear. There are no sight-distance or stopping sight-distance issues at this intersection. Four of the other crashes were located at the I-70 on and off ramps (Intersection 1). One of these was weather related, two others were failure to yield, and the fourth was due to a high rate of speed.

A signal warrant analysis was conducted using MUTCD Warrant 7 – Crash Experience. The warrant requirement for a signal, is five or more reported crashes within a 12-month period. Since there were only four reported collision crashes at both of these intersections within the five-year period, a signal is not warranted at these intersections. There is also a minimum volume requirement for Warrant 7 which is the 70% column from Table 4C-1 (see Appendix) of signal Warrant 1 from the MUTCD. This volume is not met with existing traffic volumes. A signal may be warranted if the potential development occurs and /or the rate of crashes increases.

It is, however, recommended that the intersection with Edwards Avenue (Intersection 2) be realigned and Intersection 3 be converted to a right-in, right-out intersection in the near future to increase the distance between full access intersections. Intersections with limited distance between them have the potential to increase the probability of crashes.

## 2.2 Pedestrian Movements

The City of Russell has expressed concern about pedestrians crossing Highway 281 near Intersection 2 to patronize restaurants on the opposite side from where they parked. Currently, there are no sidewalks or pedestrian crossings on either side of the highway. Because of this, pedestrians cross at random points and there are no median refuges for them on a very wide section of road.

It is recommended that sidewalks be constructed along both of the Highway 281 frontage roads. Marked pedestrian crosswalks should also be constructed at Intersection 2 with the proposed intersection improvements and also at Intersection 4 (see Figure 7). This will provide specific locations for pedestrians to cross Highway 281 and will make drivers more aware that pedestrians may be present.

The existing pedestrian volumes are very low in this area as seen in the traffic counts (see Appendix). However, if development does occur along this corridor, pedestrian volumes can be expected to increase. As such, if signal warrants are met at Intersection 2 in the future, pedestrian signalization should be incorporated. If development does not occur, pedestrian infrastructure would not be warranted.

## FUTURE CONDITIONS

A linear growth factor was applied to the 2015 PM peak hour traffic counts to determine the 2025 and 2035 forecasted background traffic volumes. Based on a traffic forecast for the intersection of Highway 281 and the I-70 off-ramp and on-ramp, it was determined that an annual growth factor of 1% would be applied. These forecast volumes can be seen in Table 3 and the 2035 volumes can be seen in Figure 5. Analysis of the 2035 PM peak hour volumes through Synchro determined the LOS for each intersection which can be seen in Figure 6 and Table 4. The LOS shown, represents a situation where traffic volumes have grown but no development has occurred.

A proposed roadway improvement layout was developed based off of the discussion at the kickoff meeting and can be seen in Figure 7. Intersection 2 (Edward Avenue) would be realigned to connect with a new road on the east side of Highway 281 and left-turn lanes would be added for eastbound and westbound traffic. Intersection 3 would be converted into a right-in, right-out access. Bruce Avenue (Intersection 4) would be extended from the west to connect with Highway 281 and it would continue east between the Sonic and Days Inn Motel. Intersection 5 would be realigned and extended to the east. All of the roads extended east of the frontage road would connect to a new North-South road where the new commercial development would be located. There are no recommended changes to Intersection 1 and Intersection 6.

The roadway improvement layout was used to determine the potential trips generated by the commercial development. Two commercial lots and ten single family residential houses were also added to the west of Highway 281 where open lots currently exist.

Development Standard trip generation rates, as published in the ITE Trip Generation Manual, 9<sup>th</sup> Edition, were used to estimate the vehicle trips generated by the anticipated development. These rates, as well as the Average Daily Traffic (ADT) and PM Peak Hour volumes generated, can be seen in Table 5.

The PM peak hour trips generated were distributed into four categories: Internal Trips, Pass-by Trips, Diverted-Link Trips and Primary Trips.

Internal Trips refer to any vehicle that makes more than one stop within the system. An example of this within our study would be a vehicle that stops at the 24/7 Store and then stops at the Pizza Hut via the frontage road. Since it did not travel along Highway 281 between destinations, it is considered an internal trip.

Pass-by trips are vehicles that are already in the traffic flow but are diverted due to the new development. Different sites attract trips at different rates and some sites do not attract pass-by trips at all. These rates can be seen in Table 6 under the “Percent Pass-by Trips” column. Pass-by trips will exit the roadway and stop at a site and then enter the roadway again heading in the same direction that they were previously heading.

Diverted-link trips are similar to pass-by trips in that they are in the flow of traffic and diverted due to the new development. However, these vehicles must use another roadway in order to access the development. An example of this within the study area would be vehicles that exit I-70 to access the development but must use Highway 281 in order to do so. These vehicles then turn back onto Highway 281 before reentering I-70. The diverted-link rates and volumes can be seen in Table 6 under “Diverted-Link Trips”.

Primary trips are new trips added to the study area as a direct result of a new development. These trips are made for the specific purpose of visiting one site and then they return to their origin. A home-to-office-to-home is one example of this. The last three columns of Table 6 show the primary trips generated by the development.

Traffic distribution was used to determine the existing traffic patterns. These patterns were then used to assign pass-by, diverted-link, and primary trips. Figures 8 – 9 show the PM peak hour pass-by trips distributed onto each intersection and the pass-by trips added to the 2035 background PM peak hour volume. Figure 10 shows the PM Peak hour diverted-link trips distributed on each intersection. Figures 11 – 12 show the 2035 traffic patterns within the study area for both vehicles turning east and vehicles turning west. These patterns were then applied to the primary trips from Table 6 and combined in Figure 13 which shows all of the primary trips generated by the development.

The total PM peak hour volume with the development-generated trips is shown in Figure 14. These volumes were analyzed using Synchro and the LOS and segment delay are shown in Figure 15 and Table 7. Most of the intersections in the study area will be operating at desirable levels during the 20-year PM peak hour forecast. However, eastbound and westbound traffic at Intersection 2 (Edwards Avenue) will be operating at a LOS “D” and “F” respectively. Westbound traffic at this intersection would have delays up to 564 seconds which is well beyond the beginning criteria of 50 seconds for LOS “F”.

Due to the heavy right-turn movements at Intersection 2, it was analyzed to see if it met warrants for a right-turn lane or right-turn deceleration taper. The directional design hourly volume (DDHV) for northbound traffic is approximately 590 vph and the speed limit in this area is 45 mph. Table 4-26 in KDOT's Access Management Policy (see Appendix) states that a right-turn volume above 95 vph will warrant a right-turn lane and a volume 50 vph will warrant a right-turn deceleration taper. 2035 traffic projections show that the right-turn volume for northbound traffic at this location will reach approximately 90 vph and 210 vph without and with development respectively. These volumes will meet the warrants for both a right-turn taper and a right-turn lane. The turn lane length at this location would not be ideal and would be less than KDOT's required turn lane lengths, but it is recommended to use all of the space that is available for a right-turn lane.

### **Left-turn Bay Length**

The existing corridor of Highway 281 from I-70 to East Witt Avenue is typical of other Kansas communities located along the I-70 corridor, such as Hays, Colby, Abilene, and WaKeeney, Kansas. The typical aspects of these communities is that development has taken place to serve the needs of the traveling public using the I-70 interstate. Such uses include mainly gas stations and truck stops with convenience stores, hospitality industry, fast food and sit-down restaurants. The sites were developed along the north- south corridor along the state highway, in this case Highway 281. All these sites have full access to Highway 281. The close proximity of access point features short left turn lanes that do not include the deceleration length, within the left-turn bay, that is required in KDOT's current Access Management Policy. Despite this, the corridor currently operates at desired levels of service with minimal impacts to the traveling public. This is not expected to change as traffic volumes on Highway 281 increase over the 20-year time period of this study. Additionally, new intersections are not proposed, but only slight realignment of existing intersections.

Some of the intersections along the commercial corridors were signalized in other similar communities, at intervals closer than the minimum 2,640 feet (half mile) specified in the KDOT Access Management Policy.

### **Signal Warrant Analysis**

A traffic signal at Intersection 2 (Edward Avenue) may be warranted, in the distant future, if built-out conditions as described in this analysis materialize. Before a decision to place a signal at this intersection is made, an update to this analysis will be required to verify the traffic conditions at that time. It needs to be emphasized, that considering the traffic volume projections of this study, the intersection of the I-70 on and off ramps with Highway 281 will not meet signal warrants, even at build-out scenario. This condition will help with the potential installation of a signal at Edwards Avenue, since it will be the only signal warranted on this corridor.

If the full development occurs, in 2035, Highway 281 would have an eight-hour vehicular volume of approximately 940 vph and the higher of the east/west leg would have an eight-hour volume of approximately 260 vph. These volumes both exceed the volumes in the Warrant 1 – Eight-hour Vehicular Volume table (see Appendix). These volumes will only meet warrants if the anticipated development occurs. Figure 16 and Table 8 show the LOS and segment delay for the corridor with a signalized Intersection 2.

The KDOT Access Management Policy requires 2,640 feet (1/2 mile) separation between an interchange and a full access intersection which is located on a four-lane highway. Signalizing Intersection 2 would conflict with this policy as there is only about 300 feet between the westbound I-70 interchange ramps and Edward Avenue. The current and projected traffic volumes of the I-70 interchange suggest that it is unlikely to be signalized in the foreseeable future.

It is recommended to signalize Intersection 2 (Edward Avenue) once the signal warrants are met. This recommendation is made considering the heavy eastbound and westbound traffic volume of Intersection 2, and despite the contradiction to the KDOT Access Management Policy. Traffic volumes will need to be monitored even after development occurs to confirm that signal warrants are met. If signal warrants are not met, it is not recommended that this intersection be signalized due to the contradictions to the KDOT Access Management Policy.

## RECOMMENDATIONS

These recommendations are based on current and projected traffic levels and the assumption that the full development on the east and west sides of Highway 281 occur. Traffic levels will still need to be monitored to ensure that the roadway continues to operate at desired levels.

Recommendations for the near future:

- Realign intersection 2 (see Figure 7) to the north to align with Edward Avenue and the north side of the 24/7 Store.
- Add sidewalks along both Highway 281 frontage roads and pedestrian crosswalks at Intersection 2 (Edward Avenue) and Intersection 4 (Bruce Avenue) to create a safe and predictable location for pedestrians to cross. (see Figure 7)
- Convert Intersection 3 to a right-in, right-out to decrease the frequency of full access intersections.

Recommendations for full development east and west of Highway 281:

- Align Intersections 4 and 5 with the City of Russell owned right-of-way where the new east-west roads would be constructed.
- Consider installing a traffic signal at Intersection 2 (Edward Avenue) when traffic signal warrant criteria is satisfied, because of high traffic volumes and the length of delay for eastbound and westbound traffic and safety concerns.
- Install a right-turn lane for northbound traffic at Intersection 2.

These improvements should result in a roadway that is safer, is more efficient and operates at a desired level of service.

## APPENDIX

**Table 4C-1. Warrant 1, Eight-Hour Vehicular Volume****Condition A—Minimum Vehicular Volume**

Number of lanes for moving traffic on each approach		Vehicles per hour on major street (total of both approaches)				Vehicles per hour on higher-volume minor-street approach (one direction only)			
Major Street	Minor Street	100% <sup>a</sup>	80% <sup>b</sup>	70% <sup>c</sup>	56% <sup>d</sup>	100% <sup>a</sup>	80% <sup>b</sup>	70% <sup>c</sup>	56% <sup>d</sup>
1	1	500	400	350	280	150	120	105	84
2 or more	1	600	480	420	336	150	120	105	84
2 or more	2 or more	600	480	420	336	200	160	140	112
1	2 or more	500	400	350	280	200	160	140	112

**Condition B—Interruption of Continuous Traffic**

Number of lanes for moving traffic on each approach		Vehicles per hour on major street (total of both approaches)				Vehicles per hour on higher-volume minor-street approach (one direction only)			
Major Street	Minor Street	100% <sup>a</sup>	80% <sup>b</sup>	70% <sup>c</sup>	56% <sup>d</sup>	100% <sup>a</sup>	80% <sup>b</sup>	70% <sup>c</sup>	56% <sup>d</sup>
1	1	750	600	525	420	75	60	53	42
2 or more	1	900	720	630	504	75	60	53	42
2 or more	2 or more	900	720	630	504	100	80	70	56
1	2 or more	750	600	525	420	100	80	70	56

<sup>a</sup> Basic minimum hourly volume<sup>b</sup> Used for combination of Conditions A and B after adequate trial of other remedial measures<sup>c</sup> May be used when the major-street speed exceeds 40 mph or in an isolated community with a population of less than 10,000<sup>d</sup> May be used for combination of Conditions A and B after adequate trial of other remedial measures when the major-street speed exceeds 40 mph or in an isolated community with a population of less than 10,000

Source: "Guidelines for right-turn treatments at unsignalized intersections and driveways," K-Tran:KSU-95-5, Kansas Department of Transportation, Kansas State University, Tanweer Hasan, Dr. Robert W. Stokes

- Turning speed is 15 mph (right-turn)
- The values presented in this table represent minimum right-turn design hour volumes (vph) required to warrant right-turn treatments (lane or taper)
- DDHV = directional design hourly volumes

CRASH REPORT PROVIDED BY KDOT

**KANSAS DEPARTMENT OF TRANSPORTATION**  
**BUREAU OF TRANSPORTATION PLANNING**  
**Geometric and Accident Data Unit**

**MOTOR VEHICLE ACCIDENT ANALYSIS**

PROJECT: KA-4176-01

ROUTE: US-281

COUNTY: Russell

**LOCATION:** Accident data on US-281 frm I-70 through the E Witt Ave intersection for the past five years  
**LENGTH:** 0.500 miles  
**TIME PERIOD:** January 1st, 2009 through December 31st, 2013

This analysis location reflects a 4-lane, divided, full access control, rural roadway for all of its length.

Million vehicle miles of travel per analysis period: 9.25

AADT (Average Annual Daily Traffic): 10,136

YEAR		ACCIDENTS				PEOPLE	
		Total	Fatal	Injury	P.D.O.*	Deaths	Injuries
2009		2	0	1	1	0	1
2010		6	0	1	5	0	1
2011		3	0	2	1	0	2
2012		2	0	0	2	0	0
2013		1	0	0	1	0	0
<b>TOTALS:</b>		<b>14</b>	<b>0</b>	<b>4</b>	<b>10</b>	<b>0</b>	<b>4</b>

\* Property Damage Only

**5-Year Rates:**

Overall accident rate per million miles of vehicle travel:	1.514
Statewide overall accident rate for similar roadway type:	0.676
Fatal accident rate per 100 million miles of vehicle travel:	0.000
Statewide fatal accident rate for similar roadway type:	0.547

Note: Short segments or minimal AADT could adversely skew accident rates.
