

**KANSAS DEPARTMENT OF TRANSPORTATION  
SPECIAL PROVISION TO THE  
STANDARD SPECIFICATIONS, EDITION 2015**

Delete SECTION 738 and replace with the following:

**SECTION 738**

**HIGH MAST LIGHT TOWERS**

**738.1 DESCRIPTION**

Construct new high mast light towers as shown in the Contract Documents.  
Repair existing high mast light towers as shown in the Contract Documents.  
See **SECTION 814**, for Electric Lighting System work.  
When drilled shaft special is specified, see special provision 15-07007, latest revision.

**BID ITEM**

High Mast Light Tower (\*) (\*\*)  
(\* ) Size  
(\*\* ) Foundation

**UNITS**

Each

**738.2 MATERIALS**

Provide high mast light tower structures from the prequalified list of fabricators. Comply with all requirements and dimensions designated in the Contract Documents.

Use material for High Mast Light Tower structures that comply with the applicable requirements:

Structural Steel Tubing.....	<b>DIVISION 1600</b>
Grade 4.0(AE) Concrete .....	<b>SECTIONS 401 &amp; 402</b>
Aggregate for Concrete Not On Grade .....	<b>SECTION 1102</b>
Concrete Admixtures .....	<b>DIVISION 1400</b>
Reinforcing Steel (Grade 60) .....	<b>DIVISION 1600</b>
Anchor Bolts .....	<b>DIVISION 1600</b>

**738.3 CONSTRUCTION REQUIREMENTS**

**a. General.** Provide and install all incidental parts which are necessary to complete the electrical system or modify existing systems as shown in the Contract Documents. See **SECTION 744** for fabrication requirements. All utility hookups are subsidiary, unless shown otherwise in the Contract Documents.

**b. Removals and Excavations.** Perform removals of existing structures and excavations to minimize damage to existing structures and right-of-way.

Remove the existing concrete foundations (including anchor bolts) to the elevation shown in the Contract Documents. Backfill the resulting holes according to **DIVISION 200**. Dispose of the removed foundations and anchor bolts.

Excavate and prepare the foundation according to **DIVISION 200**. Grade the area surrounding the completed structure in accordance with the Contract Documents.

**c. Drilled Shaft (Special).** When specified, construct the drilled shafts according to 15-07007, latest revision. Hold conduit ends and anchor bolts securely in the proper position when the concrete is placed.

Cure the drilled shafts with wet burlap or polyethylene for a period of 72 hours. Prevent concrete temperatures from falling below 32°F.

Do not attach poles until the concrete has cured for 14 days.

If a drilled shafts can not be constructed as shown in the Contract Documents because of an obstruction, the Engineer will determine how to construct the foundation.

**d. Repair/Replace Existing Structures.** Verify the existing anchors will extend a minimum of one thread above the tightened nut in the final condition. Do not damage the existing anchors during the removal of the existing hardware. Clean the threads of all rust and lubricate with an approved wax, prior to placing the new hardware.

Install DTIs on each anchor. Install a hardened washer on each anchor, if required. Use new hardware galvanized according to ASTM A 123. Verify the assembly (leveling nut, hardened washer(s), tower base plate, DTI, top nut) is in a snug tight condition before final tightening begins. Using the approved air pneumatic torque/tension wrench, or a hydraulic wrench, tighten each nut to achieve a minimum of three refusals of the 0.005 gauge. Do not exceed four refusals of the 0.005 gauge. After tightening, score the remaining threads.

**e. New Structures.** Construct the elements of the structure according to the Contract Documents. Threads of the anchors shall be free of any construction debris.

Install DTIs on each anchor. Install a hardened washer on each anchor, if required. Use hardware galvanized according to **SECTION 1616**. Verify the assembly (leveling nut, hardened washer(s), tower base plate, DTI, top nut) is in a snug tight condition before final tightening begins. Using the approved air pneumatic torque/tension wrench or a hydraulic wrench tighten each nut to achieve a minimum of three refusals of the 0.005 gauge. Do not exceed four refusals of the 0.005 gauge. After tightening, score the remaining threads.

**f. All Structures.**

- Do not use a pipe wrench to tighten nuts on High Mast Light Tower structures;
- Use only a box end or socket wrench to snug tighten nuts;
- Maintain a minimum dimension of 6 inches from the top of foundation to finished grade;
- Repair any marring of the galvanizing caused while lifting the structure into place;
- Submit specifications for the air pneumatic torque/tension wrench or the hydraulic wrench to the Construction Engineer for approval;
- If the four refusal maximum is exceeded on any DTI, discontinue tightening and contact the State Bridge Office.

**738.4 MEASUREMENT AND PAYMENT**

The Engineer will measure each high mast light tower structure for payment.

Payment for "High Mast Light Tower" structures at the contract unit price is full compensation for the specified work.

When specified for high mast light towers, Drilled Shaft (Special) is subsidiary.
